Improving Reliability and Efficiency on Urban Transportation Networks through Freight and Transit Signal Priority Strategies

Stavroula Manta & Evangelos I. Kaisar, Florida Atlantic University
Shahadat Iqbal & Mohammed Hadi, Florida International University

8TH METRANS

International Urban Freight Conference

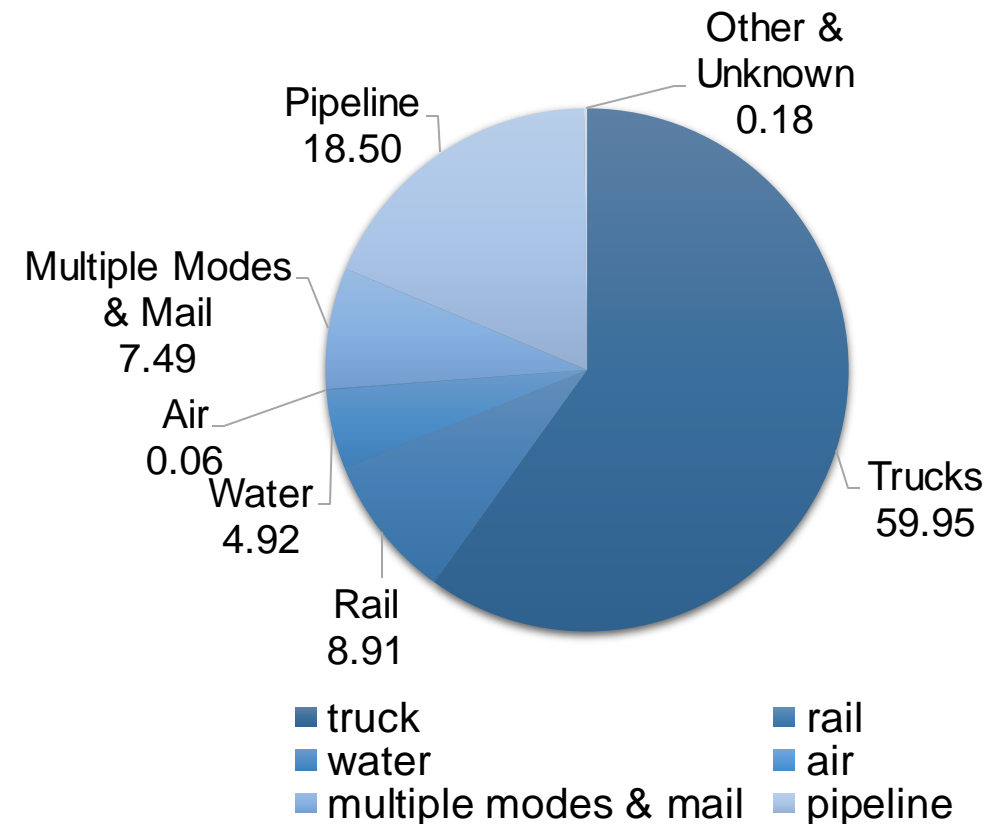

October 16-18, 2019 | Hotel Maya, Long Beach, CA

- Introduction
- Objectives
- Methodology
- Case Study
- Microsimulation Model
- Results
- Conclusions & Recommendations

Freight transport holds a fundamental role on the economic system in the United States

- 8.9% of the Nation's economic activity as measured by gross domestic product (GDP),
- 4% of total US labor force in freight transport,
- 63 tons of goods per American each year,
- 49.3 million tons - daily average freight movements,
- 52.5 billion dollars - freight value

Ton-Mile

Value of Freight

Source: Freight Analysis Framework Data

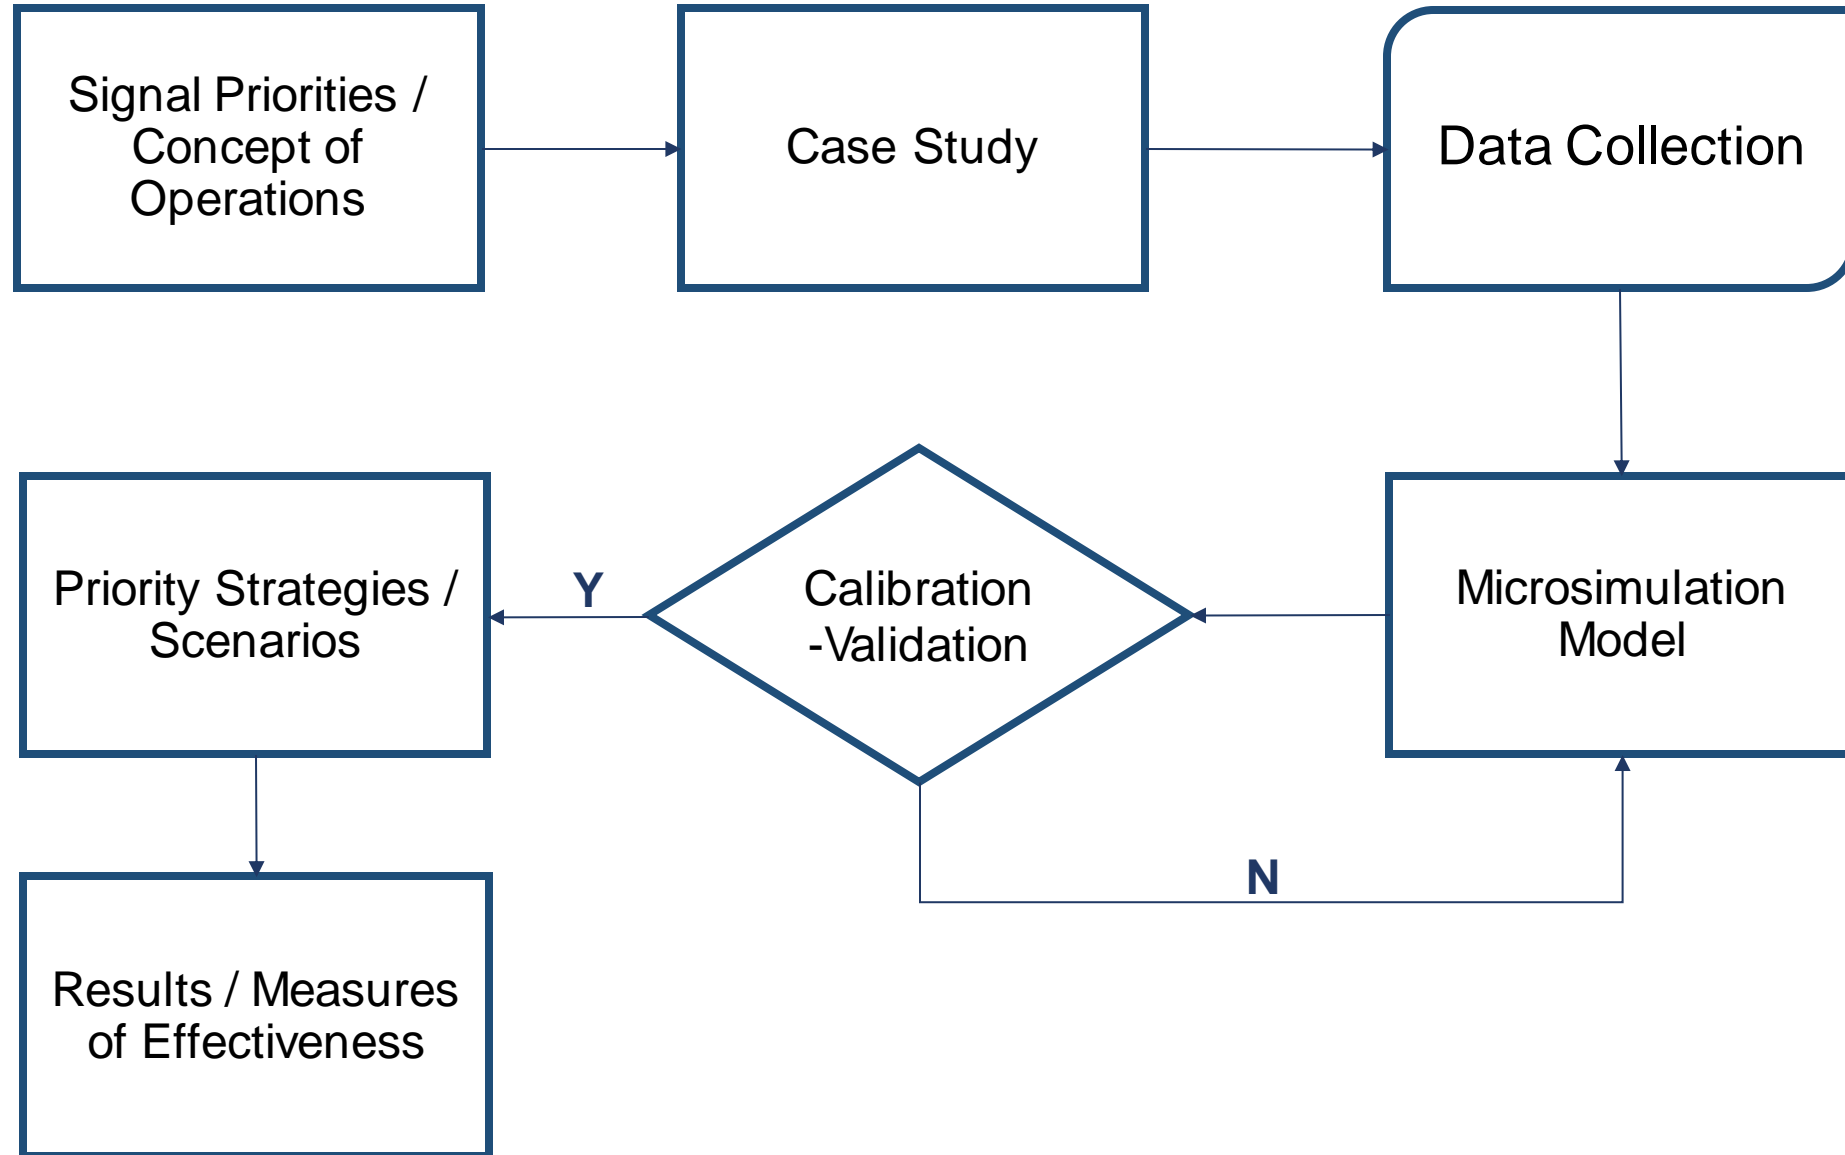

- The presence of trucks around urban areas worsens problematic situations on the traffic network.
 - Slow Dynamics.
 - Additional time for acceleration/deceleration.
 - Often stops due to signal heads.
- Trucks have significant impact on increasing congestion and affecting
 - the transit and vehicle movements,
 - the reliability and efficiency of freight operations.

Source: Federal Highway Administration

- Prioritization of the freight and transit movements along an urban multimodal corridor.
- Simultaneous implementation of Freight & Transit Signal Priority
 - improve freight mobility,
 - provide good transit services,
 - deteriorate the congested traffic conditions.

- Intelligent Transportation Systems (ITS) components.
 - unconditional preemption, (emergency vehicles, railroad crossing, drawbridge)
 - transit signal priority (TSP),
 - freight signal priority (FSP).
- **Transit Signal Priority** provides priority to transit vehicles by adjusting signal timing and phasing.
- **Freight Signal Priority** is the descendant of TSP, that uses similar technology with TSP to favor the movements of freight vehicles.

- TSP & FSP strategy aims to
 - increase travel time reliability for freight and transit vehicles,
 - enhance safety at intersections, and
 - provide environmental benefits.
- Priority strategies
 - Passive priority
 - Active priority
 - Priorities operating on real-time

RED TRUNCATION

Bus approaches red signal

Signal controller detects bus;
terminates side street green phase early

Bus proceeds on green signal

GREEN EXTENSION

Bus approaches green signal

Signal controller detects bus;
extends current green phase

Bus proceeds on extended green signal

- Support the system engineering process.
- Accommodate different
 - technology platforms,
 - products,
 - agency preferences.
- Accommodate multiple priority requests from different modes and fleets at the same.
- Priority based on
 - vehicle mode,
 - vehicle operation attributes,
 - position,
 - speed,
 - traffic and weather conditions,
 - local policies.

- Distributed Architecture
 - Sensor Classification
 - AVI/AVL Technology - Controller Cabinet
 - Approaching Priority Vehicle
 - Vehicle and Cabinet
 - Vehicle and Cabinet Utilizing Connected Vehicle (CV) Technologies
- Central Architecture
 - Fleet Management Center
 - Fleet Management Center and TMC
 - Extension of previous option with CV send information and priority level through cell communications to center

Average Travel Time for All Vehicles - EB & WB Directions

Average Travel Time for Freight Vehicles - EB & WB Directions

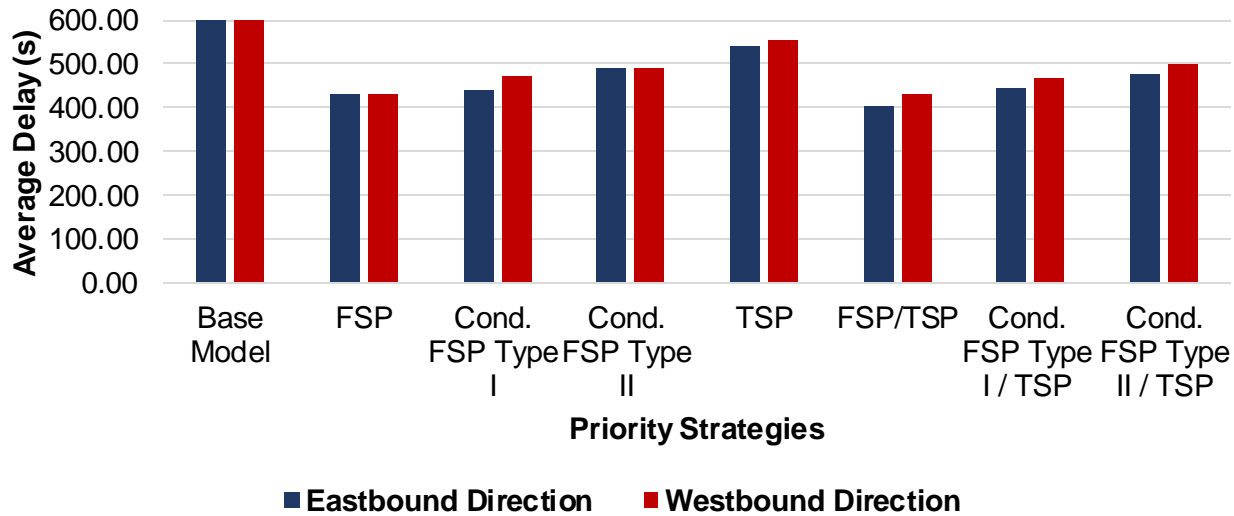

Average Travel Time for Transit Vehicles - EB & WB Directions

Average Delay for All Vehicles - EB & WB Directions

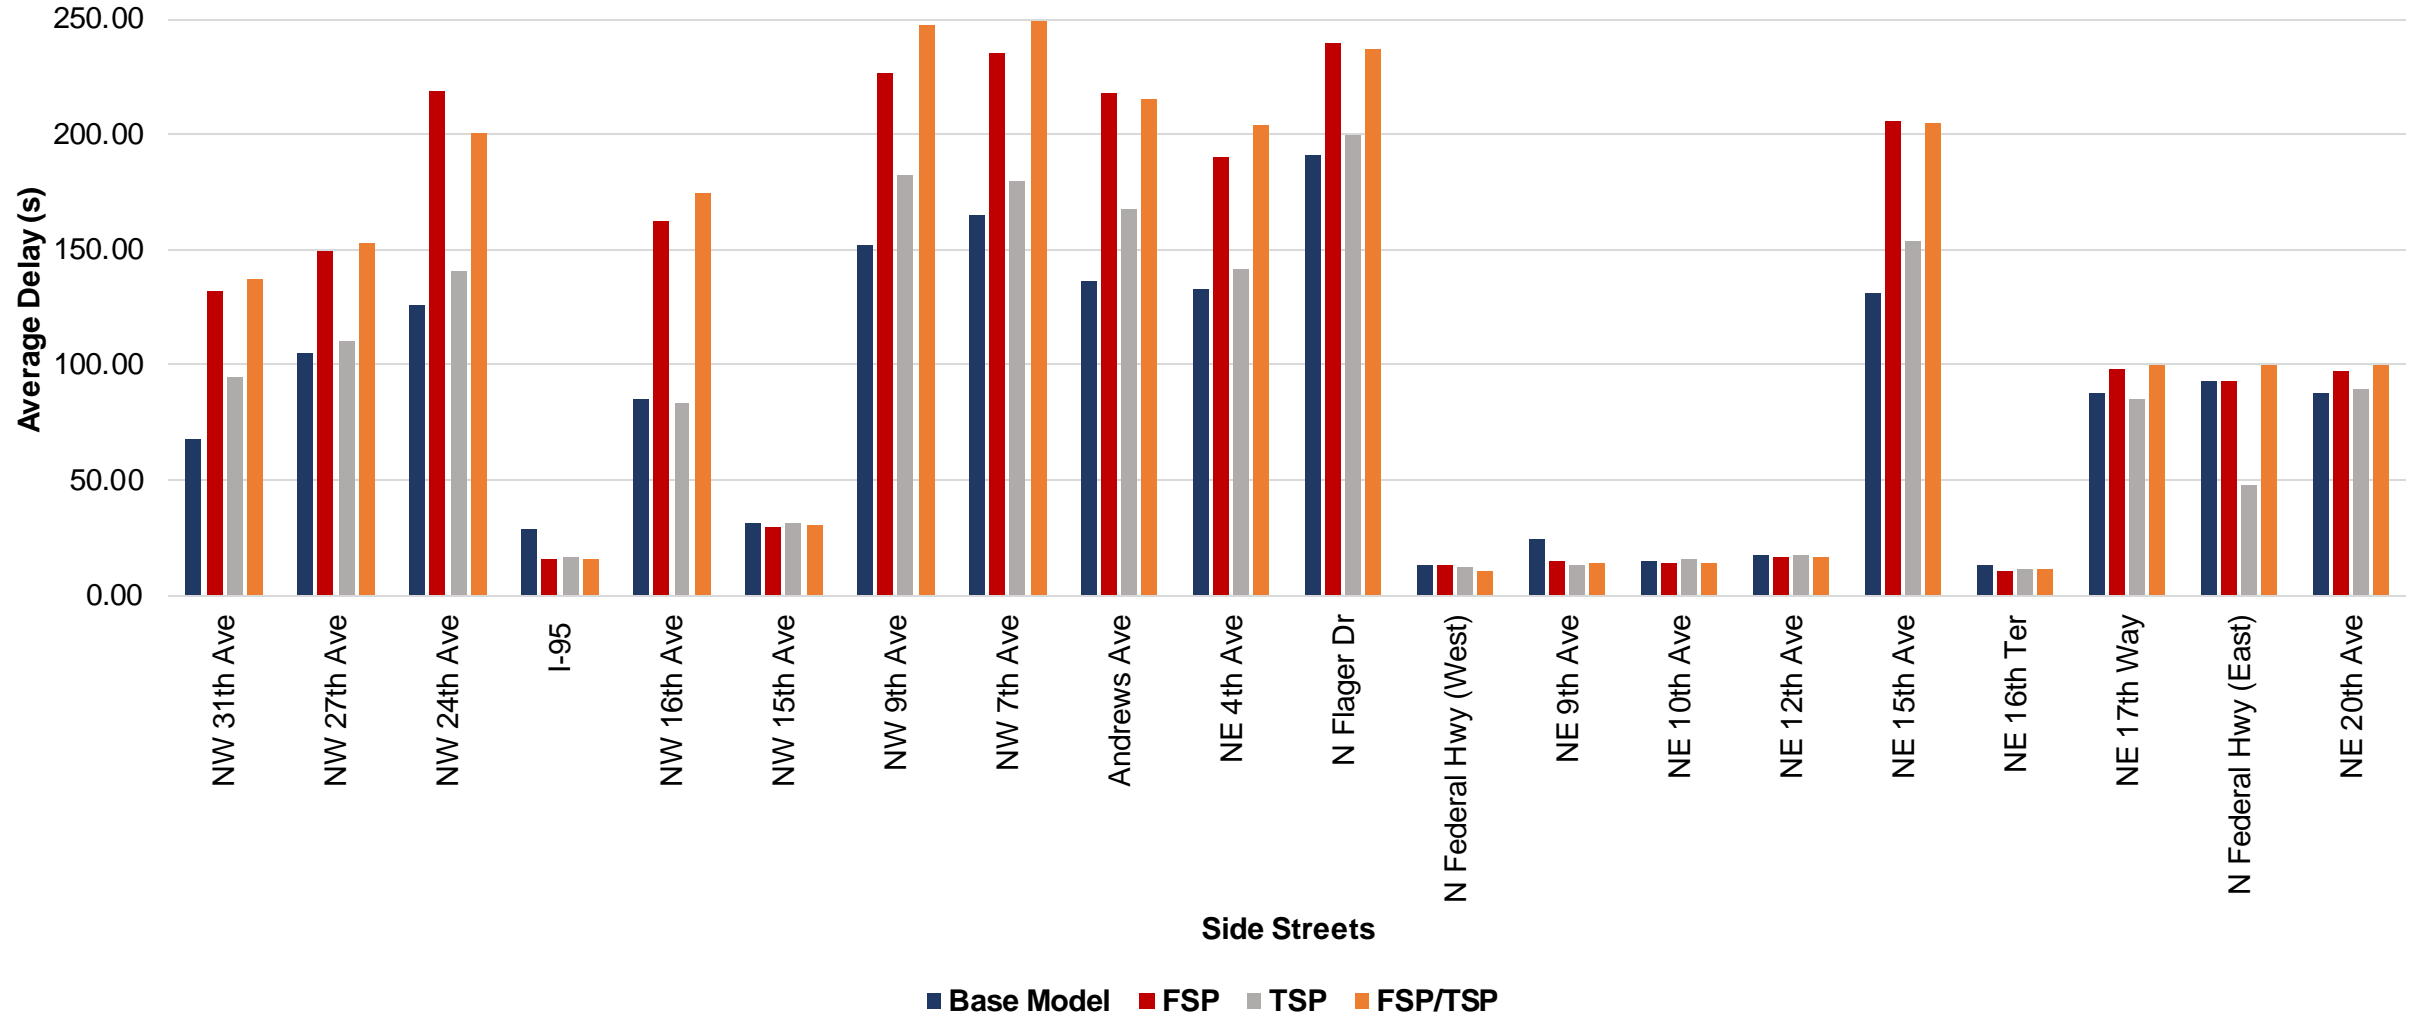

Average Delay for Freight Vehicles - EB & WB Directions

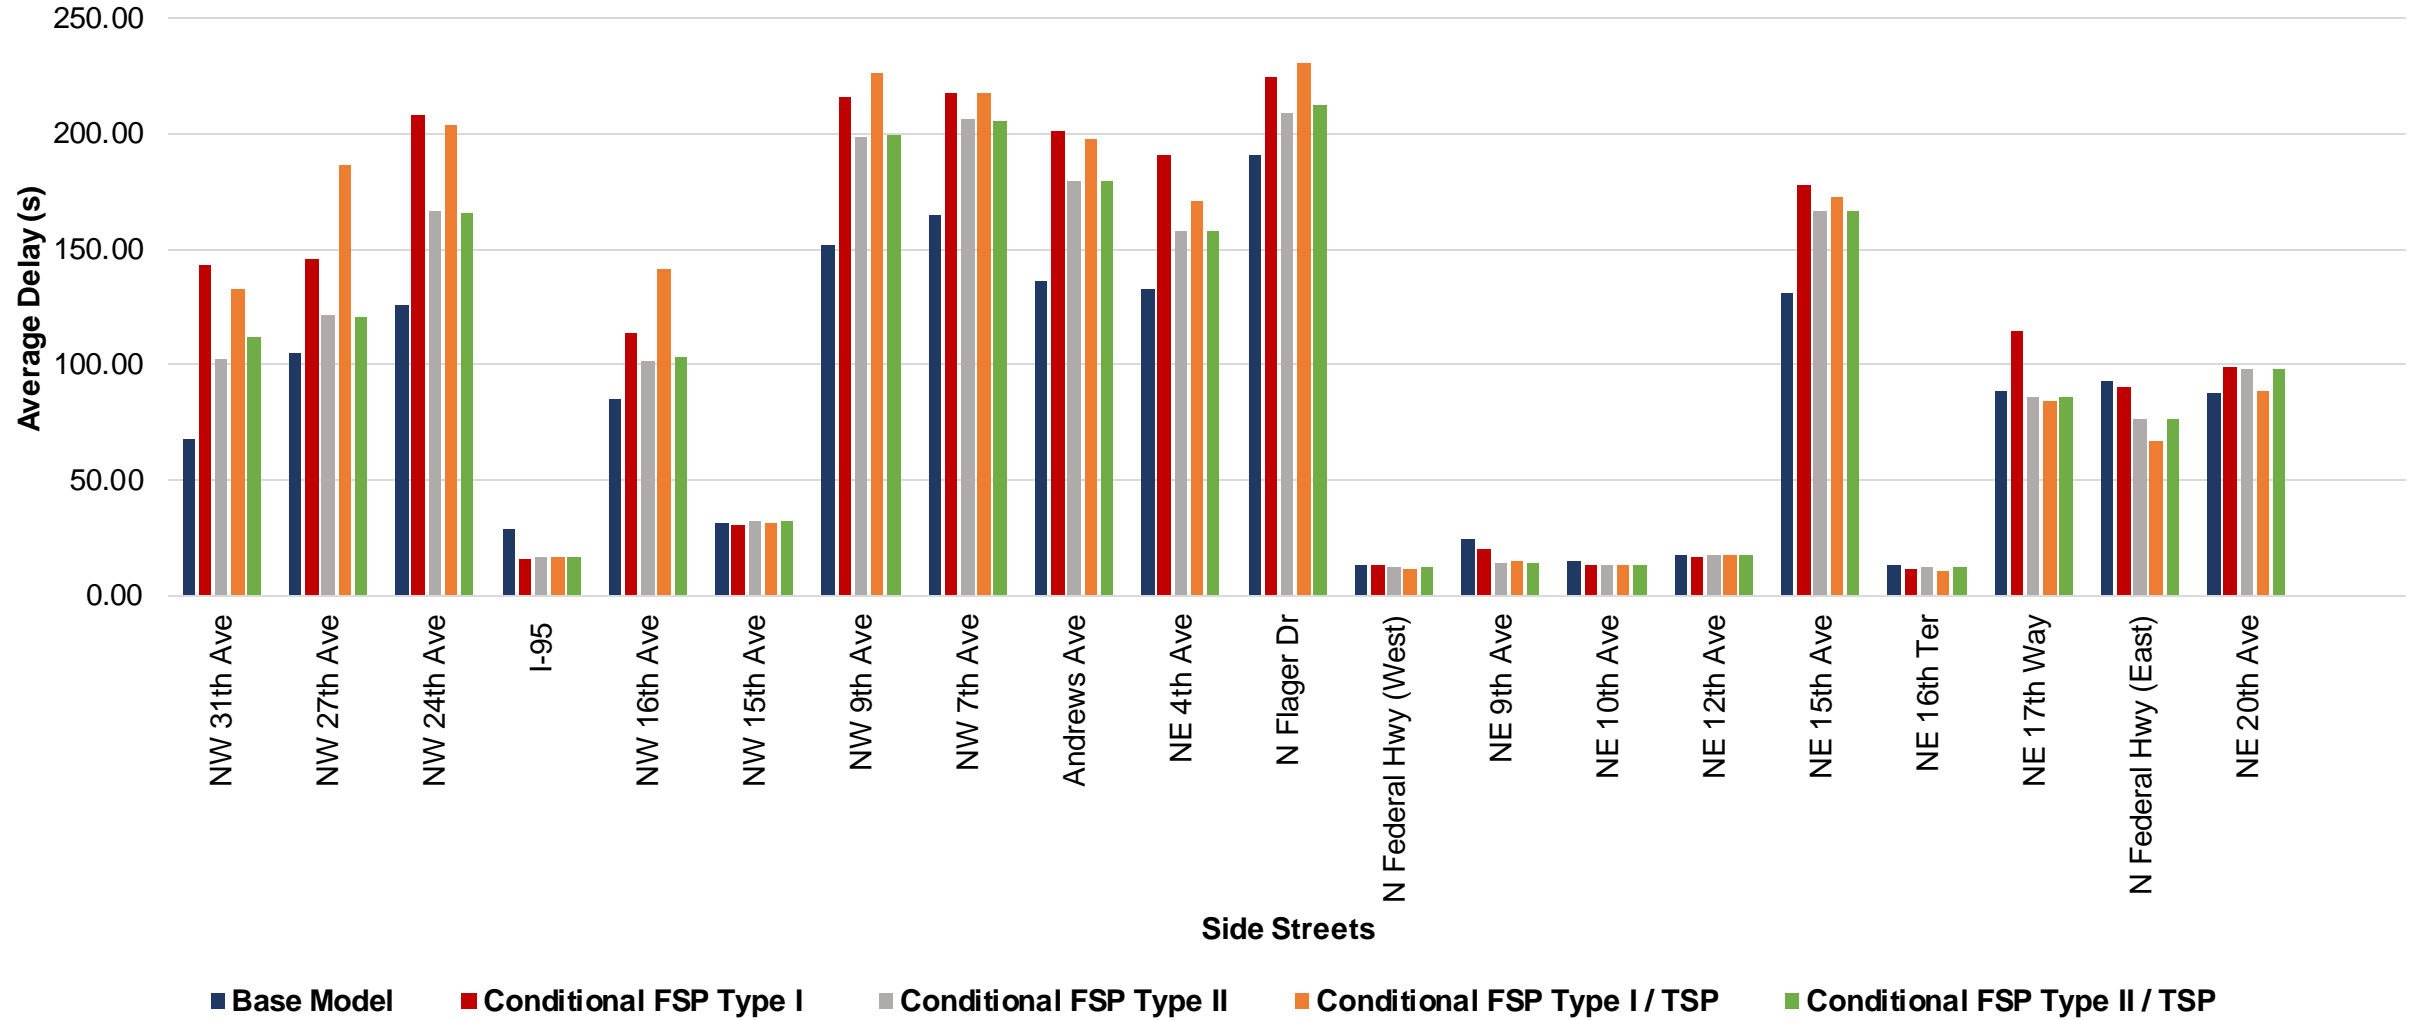

Average Delay for Transit Vehicles - EB & WB Directions

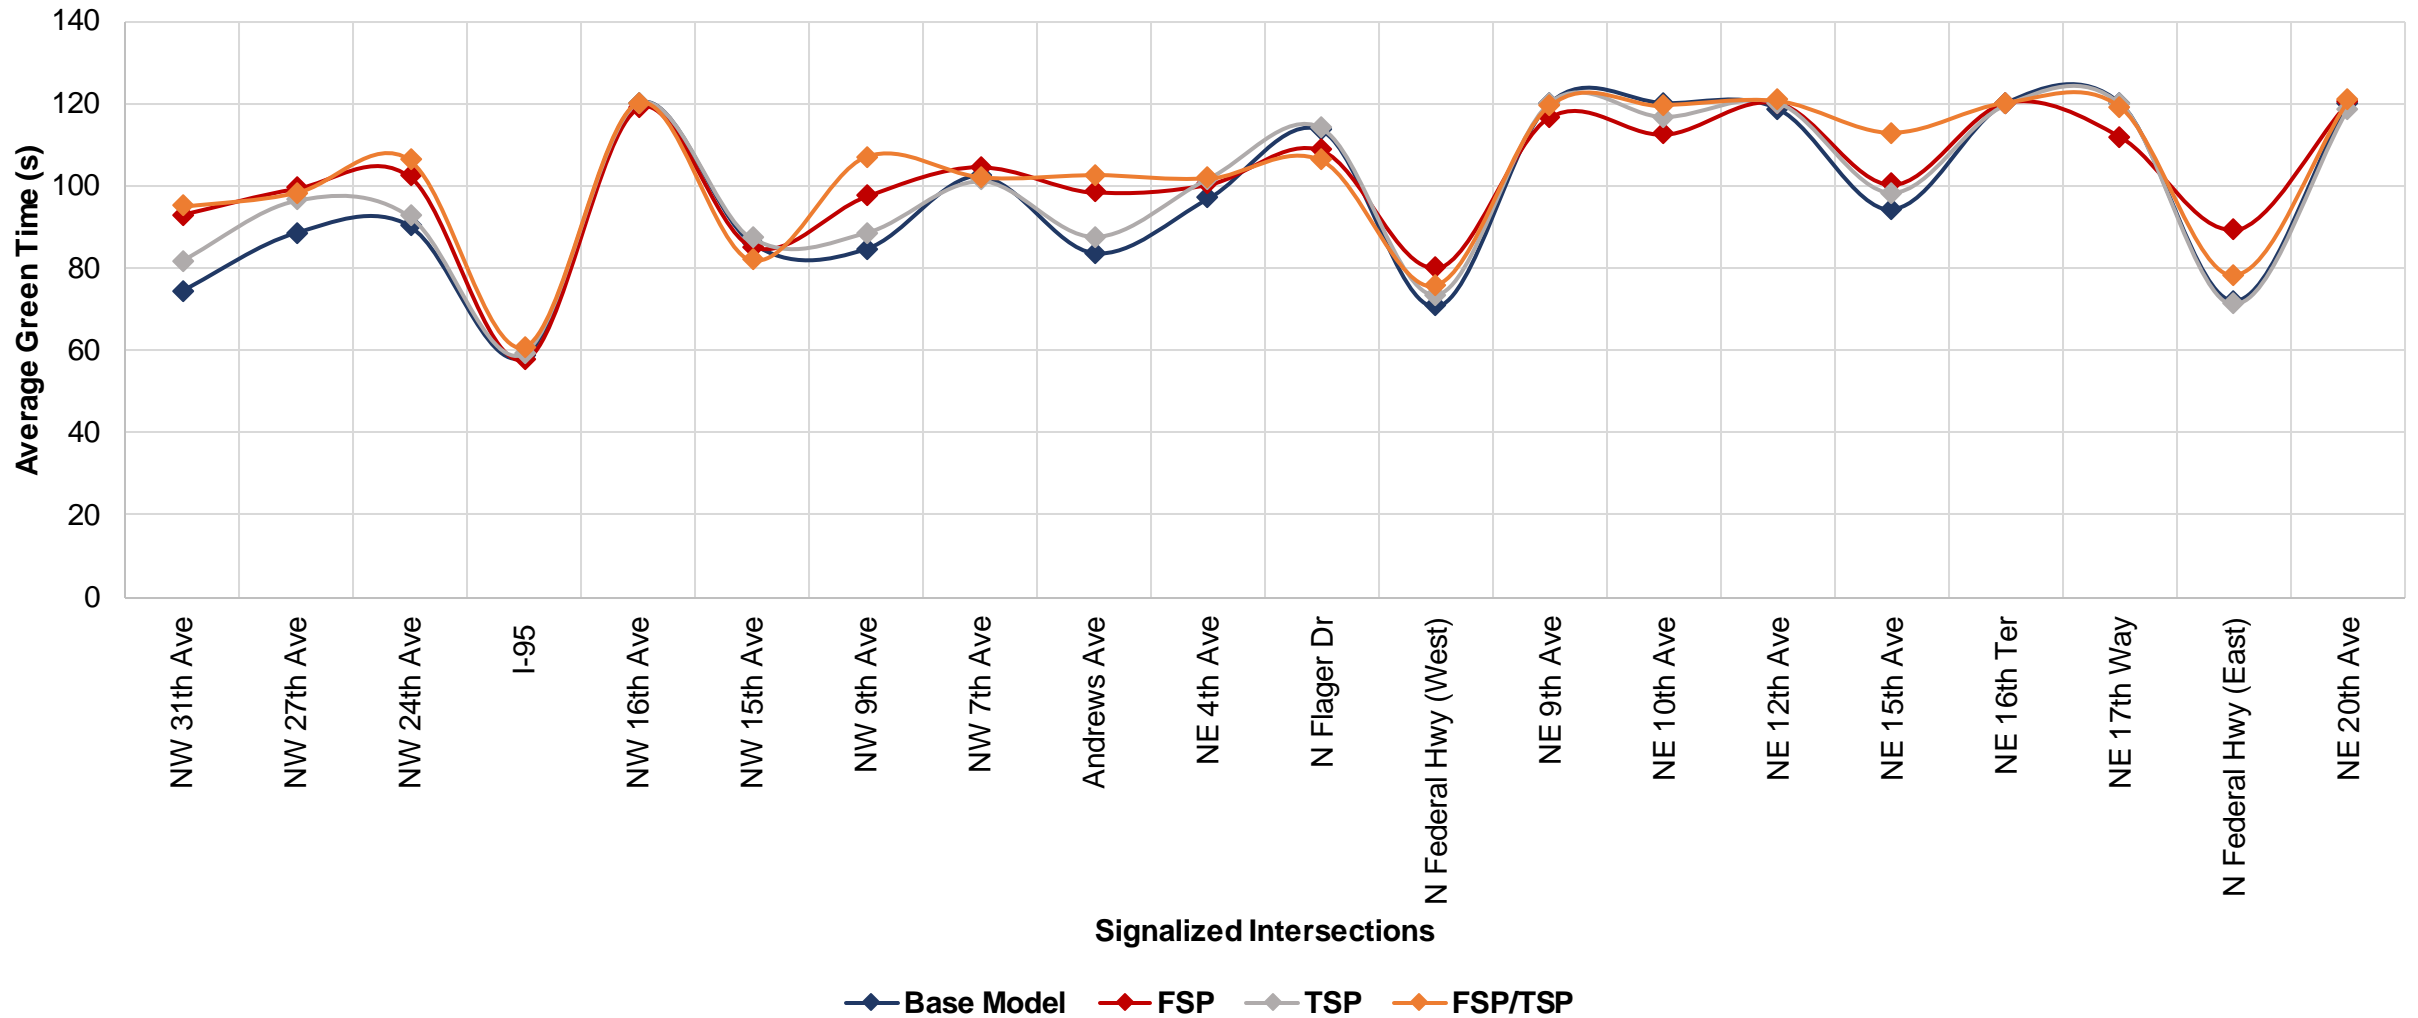

Average Delay (s) on Side Streets - Unconditional Priorities

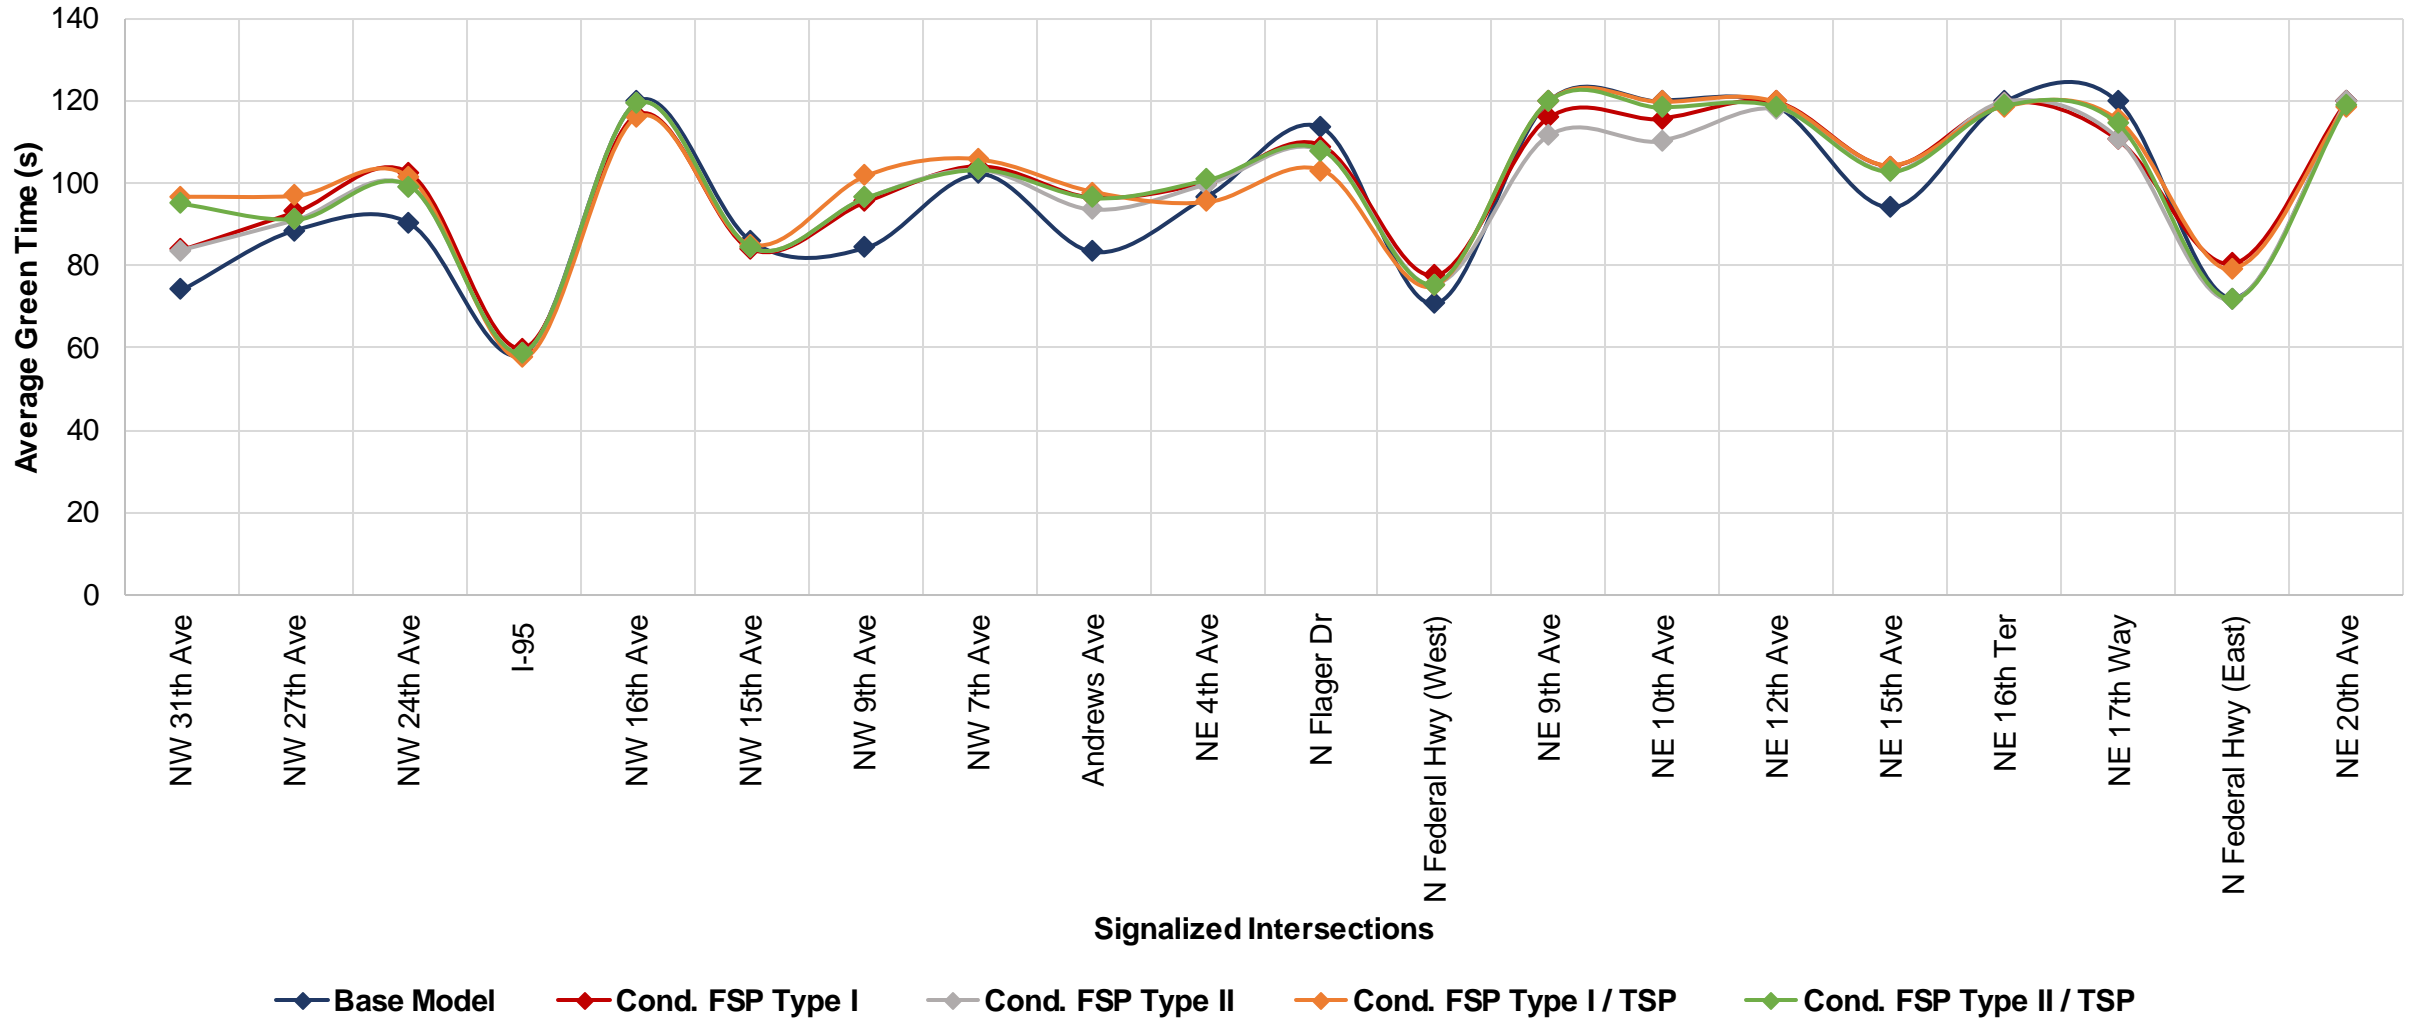

Average Delay (s) on Side Streets - Conditional Priorities

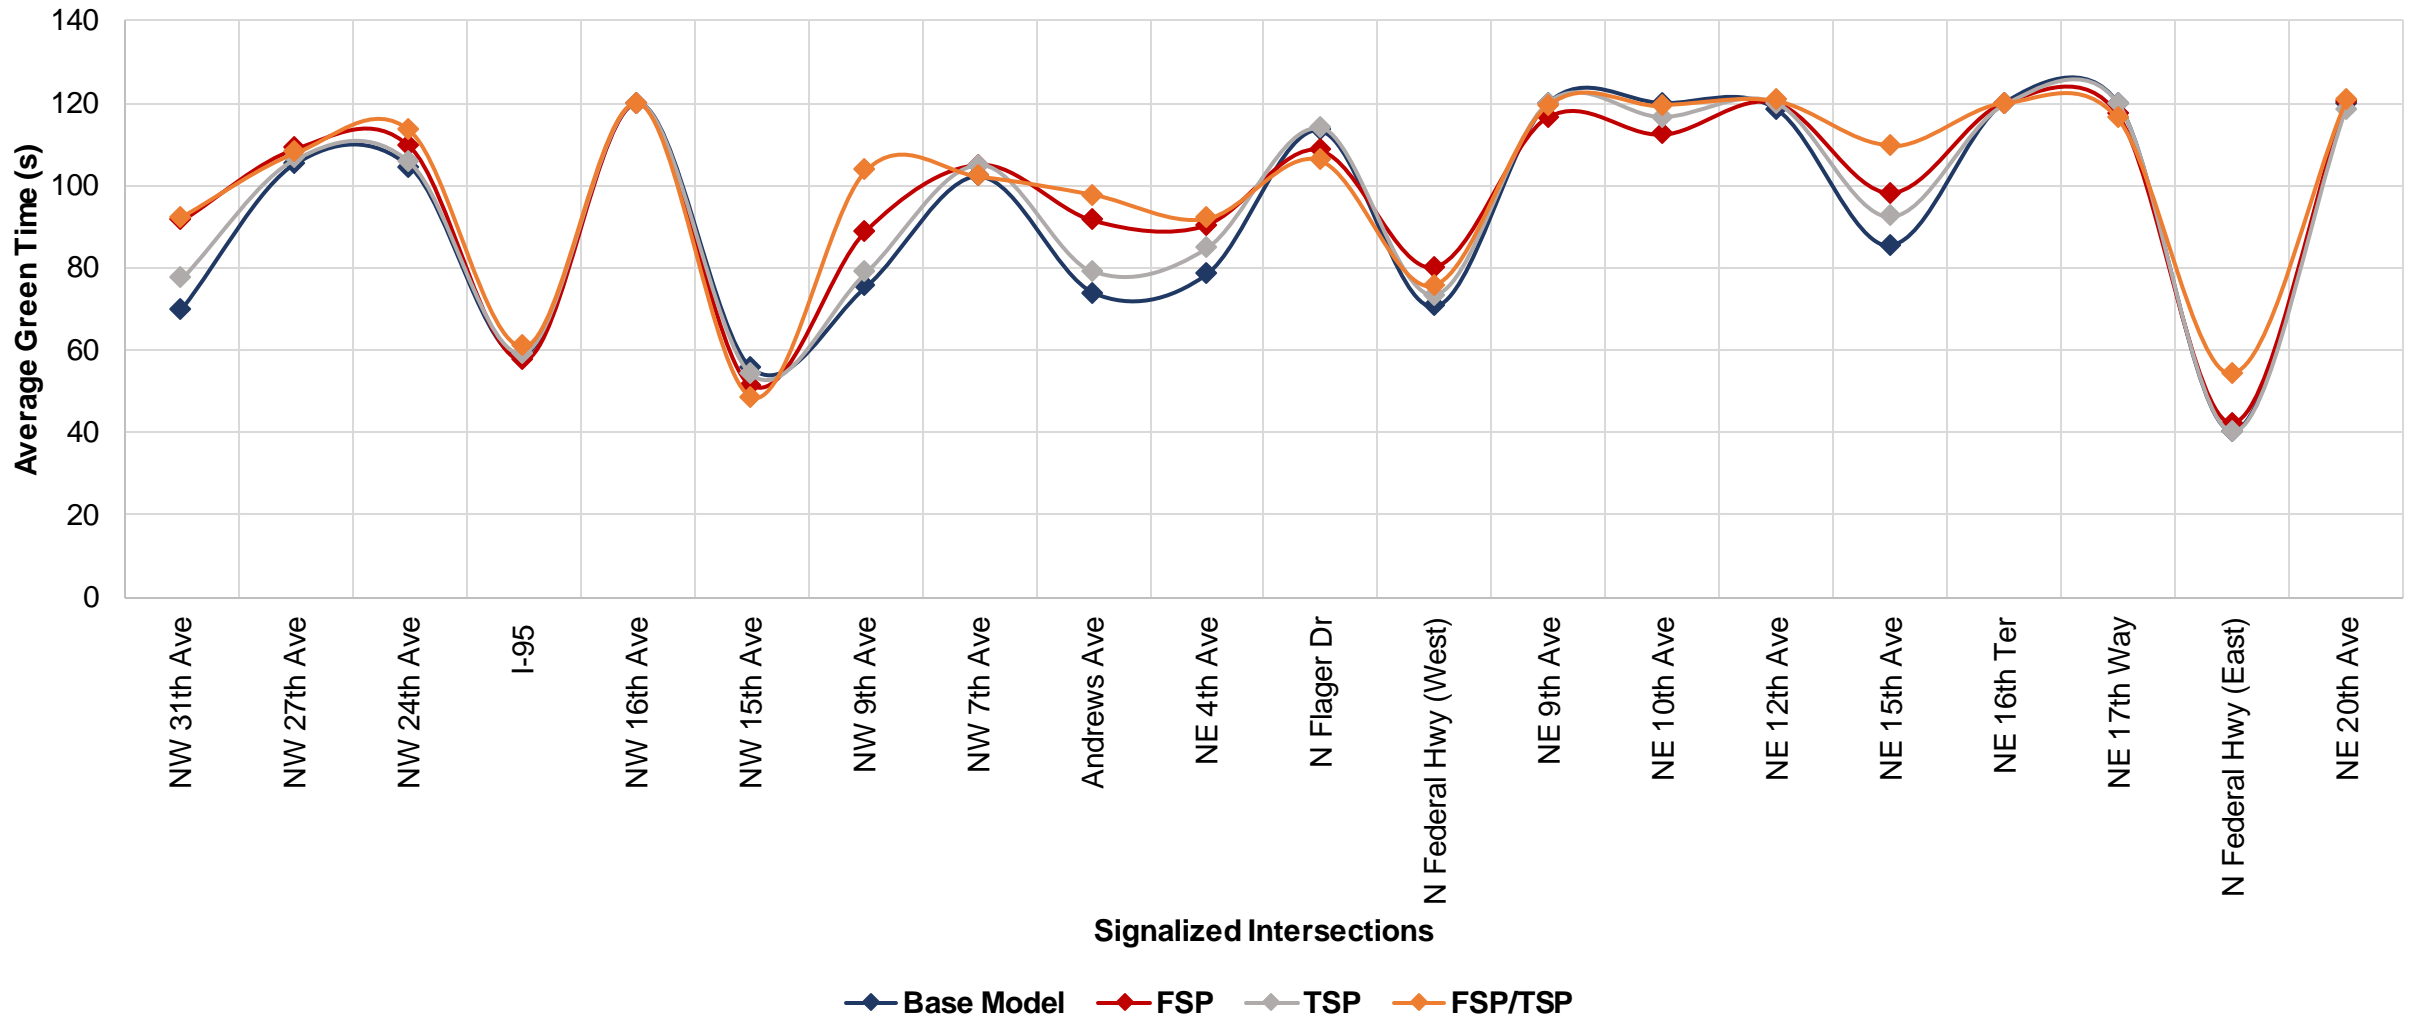

Average Green Time Duration (s) - Unconditional Priorities - EB Direction

Average Green Time Duration (s) - Conditional Priorities - EB Direction

Average Green Time Duration (s) - Unconditional Priorities - WB Direction

Average Green Time Duration - Conditional Priorities - WB Direction

- The evaluation of the FSP and TSP scenarios presented a positive effect on the freight and transit movements.
- The travel time and the delays were reduced significantly.
- The impact of the priority strategies on side street delays differs depending on the strategy applied (*FSP & FSP/TSP presented the highest delays*).
- Scenario with highest mobility improvements was the **FSP/TSP**.
- Scenario with significant mobility improvements and low impact on the side roads was the **Conditional FSP Type I / TSP**.

- Identify the aspects of freight movements that have the greatest impact on the traffic network.
- Develop scenarios with different priority weights on FSP and TSP for evaluating their collaboration.
- Implementation of FSP and TSP strategies on the main arterials of a wider network for evaluating their impact.
- Develop and propose guidelines for the efficient implementation of FSP and TSP.
